For this paper you must have
  • a calculator.

Time allowed: 1 hour 30 minutes

Instructions
• Use blue or black ink or ball-point pen.
• Fill in the boxes at the top of this page.
• Answer all questions.
• Answer the questions in Section A and Section B in the spaces provided.
• All working must be shown.
• Do all rough work in this book. Cross through any work you do not want to be marked.
• The Periodic Table/Data Sheet is provided on pages 3 and 4. Detach this perforated sheet at the start of the examination.
• Section B questions are provided on a perforated sheet. Detach this sheet at the start of the examination.

Information
• The maximum mark for this paper is 90.
• The marks for questions are shown in brackets.
• You are expected to use a calculator where appropriate.
• Write your answers to the question in Section B in continuous prose, where appropriate. You will be assessed on your ability to use an appropriate form and style of writing, to organise relevant information clearly and coherently, and to use specialist vocabulary, where appropriate.

Advice
• You are advised to spend about 1 hour on Section A and about 30 minutes on Section B.
There are no questions printed on this page
The Periodic Table of the Elements

- The atomic numbers and approximate relative atomic masses shown in the table are for use in the examination unless stated otherwise in an individual question.

(i) Deduce the order of reaction with respect to A.
...................................................................................................................................
...................................................................................................................................

(ii) Deduce the order of reaction with respect to B.
...................................................................................................................................
...................................................................................................................................

(iii) Deduce the order of reaction with respect to C.
...................................................................................................................................
...................................................................................................................................

(b) The rate equation for the reaction between compounds D and E at a given temperature is

\[
\text{rate} = k[D]^2[E]
\]

The initial rate of reaction is \(8.36 \times 10^{-4}\) mol dm\(^{-3}\) s\(^{-1}\) when the initial concentration of D is 0.84 mol dm\(^{-3}\) and the initial concentration of E is 1.16 mol dm\(^{-3}\).

Calculate a value for the rate constant, \(k\), at this temperature and deduce its units.

2 At high temperatures, PCl₅ dissociates according to the following equation.

\[
\text{PCl}_5(\text{g}) \rightleftharpoons \text{PCl}_3(\text{g}) + \text{Cl}_2(\text{g}) \quad \Delta H^\circ = +93 \text{ kJ mol}^{-1}
\]

A 2.60 mol sample of PCl₅ is placed in a sealed container and heated to a fixed temperature. At equilibrium, 1.40 mol of PCl₅ remain unreacted. The total pressure in the container is 125 kPa.

(a) Calculate the number of moles of Cl₂ and the total number of moles of gas present in the equilibrium mixture.

<table>
<thead>
<tr>
<th>Moles of Cl₂</th>
<th>.......................................................................................................................</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of moles</td>

(3 marks)

(d) Write an expression for the equilibrium constant, \( K_p \), for this reaction.

...................................................................................................................................
...................................................................................................................................

(1 mark)
(e) (i) State the effect, if any, on the value of \( K_p \) of adding more PCl\(_5\) at a constant temperature.

(ii) State the effect, if any, on the value of \( K_p \) of increasing the temperature of the container.

(2 marks)

(f) In a further experiment, a second sample of PCl\(_5\) is heated to a different temperature. In the equilibrium mixture produced at this temperature, the partial pressure of PCl\(_5\) is 36.9 kPa and the partial pressure of Cl\(_2\) is 42.6 kPa. Calculate a value for the equilibrium constant, \( K_p \), for this reaction at this temperature and give its units.

\[ \textit{Calculation} \]

\[ \textit{Units} \]

(3 marks)

Turn over for the next question
3 In this question, give all pH and pKₐ values to 2 decimal places.

(a) Hydrochloric acid is described as a strong Brønsted-Lowry acid.
   (i) State what is meant by the term Brønsted-Lowry acid.
       ...................................................................................................................................
   (ii) State why hydrochloric acid is described as strong.
       ...................................................................................................................................
       (2 marks)

(b) A sample of hydrochloric acid contains $7.05 \times 10^{-3}$ mol of hydrogen chloride in 50 cm$^3$ of solution.
   (i) Calculate the concentration, in mol dm$^{-3}$, of this hydrochloric acid.
       ...................................................................................................................................
       ...................................................................................................................................
   (ii) Write an expression for the term pH.
       ...................................................................................................................................
   (iii) Calculate the pH of this hydrochloric acid.
       ...................................................................................................................................
   (iv) When water is added to this 50 cm$^3$ sample of acid the pH increases. Calculate the total volume of the solution when the pH becomes exactly 1.00
       ...................................................................................................................................
       ...................................................................................................................................
       ...................................................................................................................................
       ...................................................................................................................................
       (6 marks)
(c) The value of the acid dissociation constant, $K_a$, for the weak acid HX is $6.10 \times 10^{-5}$ mol dm$^{-3}$ at 25 °C.

(i) Write an expression for the acid dissociation constant, $K_a$, for the acid HX.

(ii) Calculate the pH of a 0.255 mol dm$^{-3}$ solution of HX at 25 °C.

(d) A given volume of a buffer solution contains $6.85 \times 10^{-3}$ mol of the weak acid HY and $2.98 \times 10^{-3}$ mol of the salt NaY. The pH of the buffer solution is 3.78

(i) Calculate the value of $pK_a$ for the acid HY at this temperature.

(ii) State and explain the effect on the pH of the buffer solution when a small amount of hydrochloric acid is added.

Effect on pH

Explanation

(7 marks)
Compounds J, K, L and M are structural isomers of C₄H₁₀O₂. Some of these isomers are ethers. Ethers contain the C–O–C linkage. Isomers J, K, L and M can be distinguished using proton n.m.r. spectroscopy and infra-red spectroscopy.

(a) The substance TMS is used as a standard in recording proton n.m.r. spectra. Draw the structure of TMS and give two reasons why it is used as a standard. 

Structure of TMS

Reason 1 ........................................................................................................................................

Reason 2 ........................................................................................................................................

(b) State the number of peaks in the proton n.m.r. spectrum of isomer J, CH₃OCH₂CH₂OCH₃ ......................................................................................................................................

(c) (i) Isomer K, shown below, has five peaks in its proton n.m.r. spectrum. Predict the splitting pattern of the peaks due to the protons labelled a and b.

\[
\begin{array}{c}
\text{CH₃CH₂OCH₂CH₂OH} \\
\text{a} \\
\text{b}
\end{array}
\]

a ............................................................................................................................................

b ............................................................................................................................................

(ii) Identify the wavenumber of an absorption which would be present in the infra-red spectrum of K but which would not be present in the infra-red spectrum of J. ........................................................................................................................................

(3 marks)
(d) Isomer \textbf{L}, HOCH\textsubscript{2}CH\textsubscript{2}CH\textsubscript{2}CH\textsubscript{2}OH, can be used to form polyesters.

(i) Give the name of \textbf{L}.

...................................................................................................................................

(ii) Isomer \textbf{L} reacts with pentanedioic acid to form a polyester. Name the type of polymerisation involved and draw the repeating unit of the polyester formed.

\textit{Type of polymerisation} .................................................................

\textit{Repeating unit}

(4 marks)

(e) The proton n.m.r. spectrum of isomer \textbf{M} is shown below. The measured integration trace gives the ratio 0.4 to 2.4 to 1.2 for the peaks at \(\delta\) 4.6, 3.3 and 1.3, respectively.

(i) State what you can deduce from the integration value for the peak at \(\delta\) 3.3

...................................................................................................................................

(ii) Use \textbf{Table 1} on the reverse of the Periodic Table to help you identify the type of proton leading to the peak at \(\delta\) 3.3

...................................................................................................................................

(iii) Draw the part of the structure which can be deduced from the splitting of the peaks at \(\delta\) 1.3 and \(\delta\) 4.6 and from their integration values.

...................................................................................................................................

(iv) Hence, deduce the structure of \textbf{M}.

(4 marks)
5 The amino acid *alanine* is shown below.

\[
\begin{align*}
\text{CH}_3 \\
\text{H}_2\text{N} &\text{C} & \text{COOH} \\
\text{H} & & \\
\end{align*}
\]

(a) Give the systematic name for alanine.

...............................................................................................................................................

(1 mark)

(b) (i) Draw the structure of the dipeptide formed from two alanine molecules, showing clearly the full structure of the peptide link.

...............................................................................................................................................

(ii) Draw the structure of the organic compound formed by the reaction of alanine with propan-2-ol in the presence of a small amount of the catalyst concentrated sulphuric acid.

...............................................................................................................................................

(iii) Draw the structure of the *N*-substituted amide formed by the reaction of alanine with ethanoyl chloride. Name the type of mechanism involved.

*Structure*

...............................................................................................................................................

*Name of mechanism* .................................................................

(4 marks)
(c) A solution was prepared by reacting alanine with an equal number of moles of hydrochloric acid. This solution was titrated with aqueous sodium hydroxide. The titration curve obtained is shown below.

(i) Draw the structure of the alanine species present at point X on the curve.

(ii) Draw the structure of the alanine species present at point Y on the curve.

(2 marks)
6  (a) An acylium ion has the structure \( \text{R}^-\text{C}=\text{O}^+ \) where \( \text{R} \) is any alkyl group.

In the conversion of benzene into phenylethanone, \( \text{C}_6\text{H}_5\text{COCH}_3 \), an acylium ion \( \text{CH}_3\text{CO}^+ \) reacts with a benzene molecule.
Write an equation to show the formation of this acylium ion from ethanoyl chloride and one other substance.
Name and outline the mechanism of the reaction of this acylium ion with benzene.

(6 marks)

(b) Phenylethanone, \( \text{C}_6\text{H}_5\text{COCH}_3 \), reacts with HCN according to the equation below.

\[
\text{C}_6\text{H}_5\text{COCH}_3 + \text{HCN} \rightarrow \text{C}_6\text{H}_5\text{C} = \text{C} = \text{CH}_3
\]

Name and outline the mechanism of this reaction.

The product formed exists as a racemic mixture. State the meaning of the term *racemic mixture* and explain why such a mixture is formed in this reaction.

(8 marks)

(c) Acylium ions are also formed by the fragmentation of molecular ions in a mass spectrometer.
Give the name of compound \( Z \), \( \text{CH}_3\text{CH}_2\text{COCH} (\text{CH}_3)_2 \)
Draw the structures of the two possible acylium ions formed in the fragmentation of the molecular ion of \( Z \) in a mass spectrometer.
Write an equation for the formation of *one* of these acylium ions from the molecular ion of \( Z \).

(5 marks)
7  (a) Describe, by giving reagents and stating observations, how you could distinguish between the compounds in the following pairs using simple test-tube reactions.

(i) \( \text{H}_3\text{C} - \text{O} - \text{C} - \text{H} \quad \text{and} \quad \text{H}_3\text{C} - \text{C} - \text{O} - \text{H} \)

\[ \text{P} \quad \text{Q} \]

(ii) \( \text{CH}_3\text{CH}_2\text{COCl} \quad \text{and} \quad \text{CH}_3\text{CH}_2\text{Cl} \)

\[ \text{R} \quad \text{S} \]

(6 marks)

(b) (i) Give the reagents needed for the reduction of nitrobenzene to form phenylamine. Write an equation for the reaction. Use \([\text{H}]\) to represent the reductant.

(ii) Name the type of mechanism for the reaction between phenylamine and bromomethane. Draw the structure of the product of the reaction of phenylamine with a large excess of bromomethane.

(5 marks)

END OF QUESTIONS
